## **Sujet : Contrendu sur un test réaliser au Maroc sur le Produit 'Water Savr'.**

(Results of the tests conducted in Morocco with the Product 'Water\$avr')

Dear Gentlemen,

ONEPs' mission is the planning, production and at times distribution for water. But, the growth, the increase in the quality of life and the development of agriculture is forcing our department to make use of surface water because underground aquifer water is limited. This surface water is stored in dams and therefore suffers from evaporation.

To counteract the problem, ONEP contacted Water\$avr Global Solutions to start laboratory testing of the evaporation retardant (Water\$avr) that would eventually be applied to large bodies of water.

The testing lasted 9 days in three different evaporation test pans. Pan 1 received daily application, Pan 2 received application every 3 days and Pan 3 received none at all. We determined that the application of the product reduced water loss from evaporation by 30% in both treated pans. The test also determined that the application twice weekly or once every three days is sufficient.

In conclusion, this product is effective and plays a very important role in the battle to control water loss due to evaporation. It may also be important tool for water economics in hot countries.
